FinanceAI Report

NASSCOM Qualification & Project Submission Report

NASSCOM Submitted

Project Name: FinanceAI - Personal Financial Advisor

Author / Repository: Sumit Deshmukh

GitHub Source: github.com/sumitdeshmukh/sumit-deshmukh.git

Tech Stack: React, Tailwind CSS, Google Gemini API, Node.js

1. Executive Summary

FinanceAI is an intelligent, accessible web application designed to democratize personal wealth management and financial guidance. By integrating Google's Gemini Generative AI engine with real-time financial tracking, FinanceAI offers personalized budgeting plans, debt payoff strategies, and customized investment recommendations based on individual user risk profiles.

2. Core Features & Capabilities

AI Financial Advisor

Generates instant health scores, 50/30/20 budget allocations, and personalized action plans driven by Gemini AI.

Dynamic Dashboard

Provides immediate visibility into monthly net cash flow, savings rates, expense breakdowns, and total debt.

Milestone & Goal Tracking

Allows users to create custom financial targets (e.g., Emergency Funds) with live progress calculation.

Bank-Grade Security

Implements JWT token authentication, secure password hashing, and user-isolated session storage.

3. Interface Architecture & Dashboard Overview

Figure 1: Main Financial Overview Dashboard featuring income, expense trends, savings rates, and active debt analytics. (Video Timestamp: 00:18)

4. System Architecture & Tech Stack

Layer	Technologies Used	Description
Frontend UI	React, Tailwind CSS, Lucide Icons, Vite	Responsive component-based application interface styled with modern utility classes.
AI Integration	Google Gemini API (`@google/generative-ai`)	Processes personal financial context to generate dynamic recommendations and health scores.
Authentication	JSON Web Tokens (JWT), LocalStorage API	Secure session persistence and isolated user profile storage.

5. Module Deep-Dive: AI Financial Mentor

Figure 2: AI Advisor Engine calculating Financial Health Score (95/100) and generating personalized 50/30/20 budget allocations. (Video Timestamp: 00:31 - 01:36)

6. Workflow & Data Flow Architecture

The system follows a streamlined data flow where user financial baselines (Monthly Income, Current Savings, Total Debt, Risk Preference) are structured into a standardized context block. This context is submitted to the Gemini API endpoint, which returns structured JSON recommendations including:

- **Overall Health Score:** Numeric evaluation out of 100 with qualitative status.
- **Spending Analysis:** Highlighting discretionary expenditures and potential savings.
- **Recommended Budget:** Breakdown across Needs (50%), Wants (30%), and Savings (20%).
- **Personalized Action Steps:** Ranked emergency fund, debt paydown, and investment priorities.

7. Financial Goals & Milestone Planning

Figure 3: Financial Goals module showing active Emergency Fund tracking with live milestone progress indicators. (Video Timestamp: 01:51 - 02:49)

8. Installation & Deployment Guide

To run the project locally or evaluate for submission verification, execute the following commands:

```
# 1. Clone the repository

# 2. Navigate to project root & install dependencies

npm install

# 3. Configure Environment Variables
echo "VITE_GEMINI_API_KEY=your_gemini_api_key" > .env

# 4. Start local development server
npm run dev
```

9. Conclusion & Project Roadmap

FinanceAI bridges the gap between complex financial planning and everyday usability. The project successfully demonstrates the integration of Generative AI to provide accessible, real-time financial mentoring.

Future Expansion: Planned future developments include automated bank feed integration (Plaid API), localized tax computation for regional frameworks, and multi-currency portfolio management.
